

MABATIROLLINGMILLSKE Catalogue Price Sorting

Here's how we extend your **MABATIROLLINGMILLSKE catalogue** with **price sorting** so customers can view products from cheapest to most expensive (or vice versa).

Sorting Component

PriceSort.jsx

```
export default function PriceSort({ onSort }) {  
  return (  
    <div className="flex items-center space-x-4 mb-6">  
      <label htmlFor="sort" className="font-semibold">Sort by Price:</label>  
      <select  
        id="sort"  
        onChange={(e) => onSort(e.target.value)}  
        className="border p-2 rounded"  
      >  
        <option value="">Default</option>  
        <option value="asc">Lowest First</option>  
        <option value="desc">Highest First</option>  
      </select>  
    </div>  
  );  
}
```

Updated Catalogue with Sorting

Catalogue.jsx

```

import { useState } from "react";
import ProductCard from "../ProductCard";
import ProductFilter from "../ProductFilter";
import PriceSort from "../PriceSort";

const products = [
  { name: "Box Profile Glossy", price: 420, gauge: "30", finish: "Glossy", image: "/images/box-profile-glossy.jpg" },
  { name: "Box Profile Matte", price: 520, gauge: "30", finish: "Matte", image: "/images/box-profile-matte.jpg" },
  { name: "Versatile Matte", price: 550, gauge: "30", finish: "Matte", image: "/images/versatile-matte.jpg" },
  { name: "Romantile Glossy", price: 550, gauge: "30", finish: "Glossy", image: "/images/romantile-glossy.jpg" },
  { name: "Jenga Tile Grey", price: 550, gauge: "30", finish: "Matte", image: "/images/jenga-tile-grey.jpg" },
  { name: "Brick Tile Red", price: 450, gauge: "30", finish: "Matte", image: "/images/brick-tile-red.jpg" },
];

export default function Catalogue() {
  const [filtered, setFiltered] = useState(products);

  const handleFilter = ({ search, gauge, finish }) => {
    let result = products;
    if (search) {
      result = result.filter(p => p.name.toLowerCase().includes(search.toLowerCase()));
    }
    if (gauge) {
      result = result.filter(p => p.gauge === gauge);
    }
    if (finish) {
      result = result.filter(p => p.finish === finish);
    }
    setFiltered(result);
  };

  const handleSort = (order) => {
    let sorted = [...filtered];
    if (order === "asc") {
      sorted.sort((a, b) => a.price - b.price);
    } else if (order === "desc") {
      sorted.sort((a, b) => b.price - a.price);
    }
    setFiltered(sorted);
  };

```

✓ Features Now Covered

- **Search bar** → find products by name.
 - **Gauge filter** → G28 or G30.
 - **Finish filter** → Glossy or Matte.
 - **Price sorting** → ascending (cheapest first) or descending (premium first).
 - **Accessible controls** → labels, ARIA attributes, keyboard focus styles.
-

Deployment

1. Add PriceSort.jsx to components/.
2. Update Catalogue.jsx with sorting logic.
3. Push to GitHub:

```
git add .  
git commit -m "Add price sorting to catalogue"  
git push
```

4. Netlify auto-deploys with updated catalogue.

Now your site has **homepage, catalogue, enquiry form, floating WhatsApp/Call buttons, accessibility fixes, product filtering, search, and price sorting** - a complete professional e-commerce flow.

Would you like me to also [add pagination or infinite scroll](#) so the catalogue can scale to hundreds of mabati products without slowing down?
